EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Attorney Surinder Sachar on July 16, 2008.

The application has been amended as follows:

Please amend the following claim:

Claim 19 (**Currently Amended**): A computer readable recording medium storing a computer program code which controls a portable terminal, to perform controls comprising:

communicating with other communication devices located at a prescribed range;
searching a communication device capable of communicating;

acquiring first identification information transmitted from the searched communication device;

extracting a service name, inherent information and encryption data from the acquired first identification information;

decrypting the encryption data by using a prescribed decryption key; comparing the decoded data with the extracted service name and inherent information, and determining whether or not the communication device searched by the searching unit is reliable based on the comparison result;

and inhibiting communication with the communication device determined to be unreliable by the comparison result.

Allowable Subject Matter

1. Claims **1-17 and 19-20** are allowed.
2. The following is an examiner's statement of reasons for allowance: The present invention is directed towards a wireless communication device for communicating at a relatively narrow range such as Bluetooth, a portable terminal for communicating with such kind of wireless communication device, a communication control program and a communication system. Each independent claim identifies the uniquely distinct features **"a second identification information generator which generates second identification information including the service name, the inherent information and the encryption data, the encryption data including encrypted first identification information including a service name of available service and inherent information, the second information includes a service name and inherent information which is not encrypted and data with the encrypted service name and inherent information"**.

The closest prior art, Kinoshita (Pub No. 2003/0007641) discloses a wireless data communication device for performing a short-distance wireless data communication. The device comprises an infrared communication section, a CPU, a memory, an encryption/decryption unit, and a wireless communication section. The infrared communication section exchanges shared key data with a station that is

another party of wireless data communication. The key data is required in identifying the station and encrypting data to be transmitted to the station. The CPU stores the shared key data into the memory. The key data is read from the memory. Using the key data, the encryption/decryption unit encrypts and decrypts data. The wireless communication section receives the data encrypted by the encryption/decryption unit and transmits it to external apparatuses.

However, either singularly or in combination, Kinoshita fail to anticipate or render obvious communicating information including both data with an encrypted service name and inherent information and the service name and inherent information itself (i.e. which has not been encrypted). Kinoshita does not disclose any transmission of a service name and inherent information and data with the encrypted service name and inherent information.

The closest prior art, Billhartz (Pub No. 2004/0015689) discloses a mobile ad-hoc network may include a first node having a first public key and a first private key associated therewith for generating an authentication request. The network may also include a second node having a second public key and a second private key associated therewith for receiving the authentication request and returning a certificate of authenticity including the second public key to the first node. Upon verifying that the second public key belongs to the second node, the first node may send challenge data to the second node, and the second node may encrypt the challenge data using the second private key and return the encrypted challenge data back to the first node. The first node may thus decrypt the encrypted challenge data using the verified second

public key and authenticate the second node if the decryption of the encrypted challenge data yields the original challenge data.

However, either singularly or in combination, Billhartz fail to anticipate or render obvious that encryption is obtained by encrypting a service name and inherent information, and that such encryption data is transmitted in addition to transmitting the service name and the inherent information. Billhartz fail to disclose that encryption data included in reception information is decrypted, the service name and inherent information included in the reception information is compared with the decrypted information, and that it is thereby determined whether a communication partner is trustworthy.

4. Therefore, **claims 1, 7, 19, and 20** and the respective **dependent claims 2-6 and 8-17** are in condition for allowance.

Conclusion

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
